Neuware - The network approach to scientific investigation is spreading, and with it the demand for appropriate analytical means. With one powerful instance of these means being computer-based modeling, the Viennese Network for the Simulation of Complex Systems has dedicated a part of its activities to the topic of networks. This reader comprises a selection of texts that have been put together to provide an accessible, though compact overview on the scope that the network approach meanwhile developed. The network approach to scientific investigation is spreading. The last two decades saw a dynamic diffusion of attention for network issues. Disciplines like physics, chemistry, biology, mathematics, computer sciences, sociology, economics, even geography, linguistics or historiography, left alone interdisciplinary endeavors like systems sciences or complexity research, swiftly adopted the approach and adapted it to their demands. With it came the need to reconsider fundamental assumptions of classical research. While analytics so far often focus on attempts to isolate objects under laboratory conditions in order to observe them unperturbed by the particularities of daily contexts, the network approach forces to respect interrelations. Networks make it difficult to regard objects on their own. Whatever is conceived as a node in a network is conceived in relation to other nodes. There is no single and thus relation-less node. Even if unconnected, a node has the relation of being unconnected to others. A node is always in some sense to others in networks. Of course, this raises difficult questions - concerning delimitations for instance. Where does one network begin and where does another one end Where does a chain of causations begin and up to where last its effects What do the nodes of a network consist of And what its links In...
